

ABSTRACT

5 A vehicle soft top with a main body and
removable panels. Each panel is at least partially
received in a conforming cutout section in the main
body and has a plurality of sides with the upper
side preferably secured to the upper side of the
cutout section by a pair of interconnecting, sliding
members. The interconnecting members have mating
hook portions that can be aligned with one another
and slid axially relative to each other to hold the
upper sides of the panel and main body together. A
10 zipper is preferably used to secure second sides of
the panel and cutout section together and the
remaining sides are preferably secured together with
either belt and channel arrangements or additional
15 zippers.
